

# Packaging line

01 | 2010

**DIEFFENBACHER**

## Packaging line

- The packing of your product often determines your customer's first impression. A high-quality product packed in a high-quality package can make a major difference.
- Our packaging lines can easily handle different package sizes as well as packaging materials.
  - Integrated to cut-to-size sawing line for automatic operation
  - Suitable for variable stack sizes
  - Possibility for variable packing types for domestic and export packaging

## Packaging line

- The stacks cut to final sizes can be separated in a transfer carriage and fed automatically one after another to the packaging line.
- The stacks pass by a panel-edge printer, which marks the panels with the identifying information required by the European Standard EN 312-4. The information can include, for example, producer, product information, production time and barcode.
- Customer stacks can be wrapped with protective plastic foil using an automatic wrapping machine.
- After wrapping, stacks can be bundled with straps. This can be undertaken with a fully automatic strapping machine or semi-automatically.
